

Abstract of the Disclosure

A voting system generating method automatically allocates
a vote-recording function to a machine that includes a storage
medium and that is first connected to a network. The method then
5 automatically allocates a backup vote-recording function to a
machine that includes a storage medium and that is secondly or
later connected to the network. The method then automatically
allocates a normal voting machine function to a machine which
includes no storage medium and which is connected to the network
10 after the vote-recording machine is set up.
